STEADY FLOW OPTIMIZATION

Optimized
Steady Flow
Level

=

of pallets for which the **Total Savings** are maximized

Total Savings

=

Transportation
Savings

+

Cross-dock
Savings

-

Excess Inventory
Cost

For each SKU

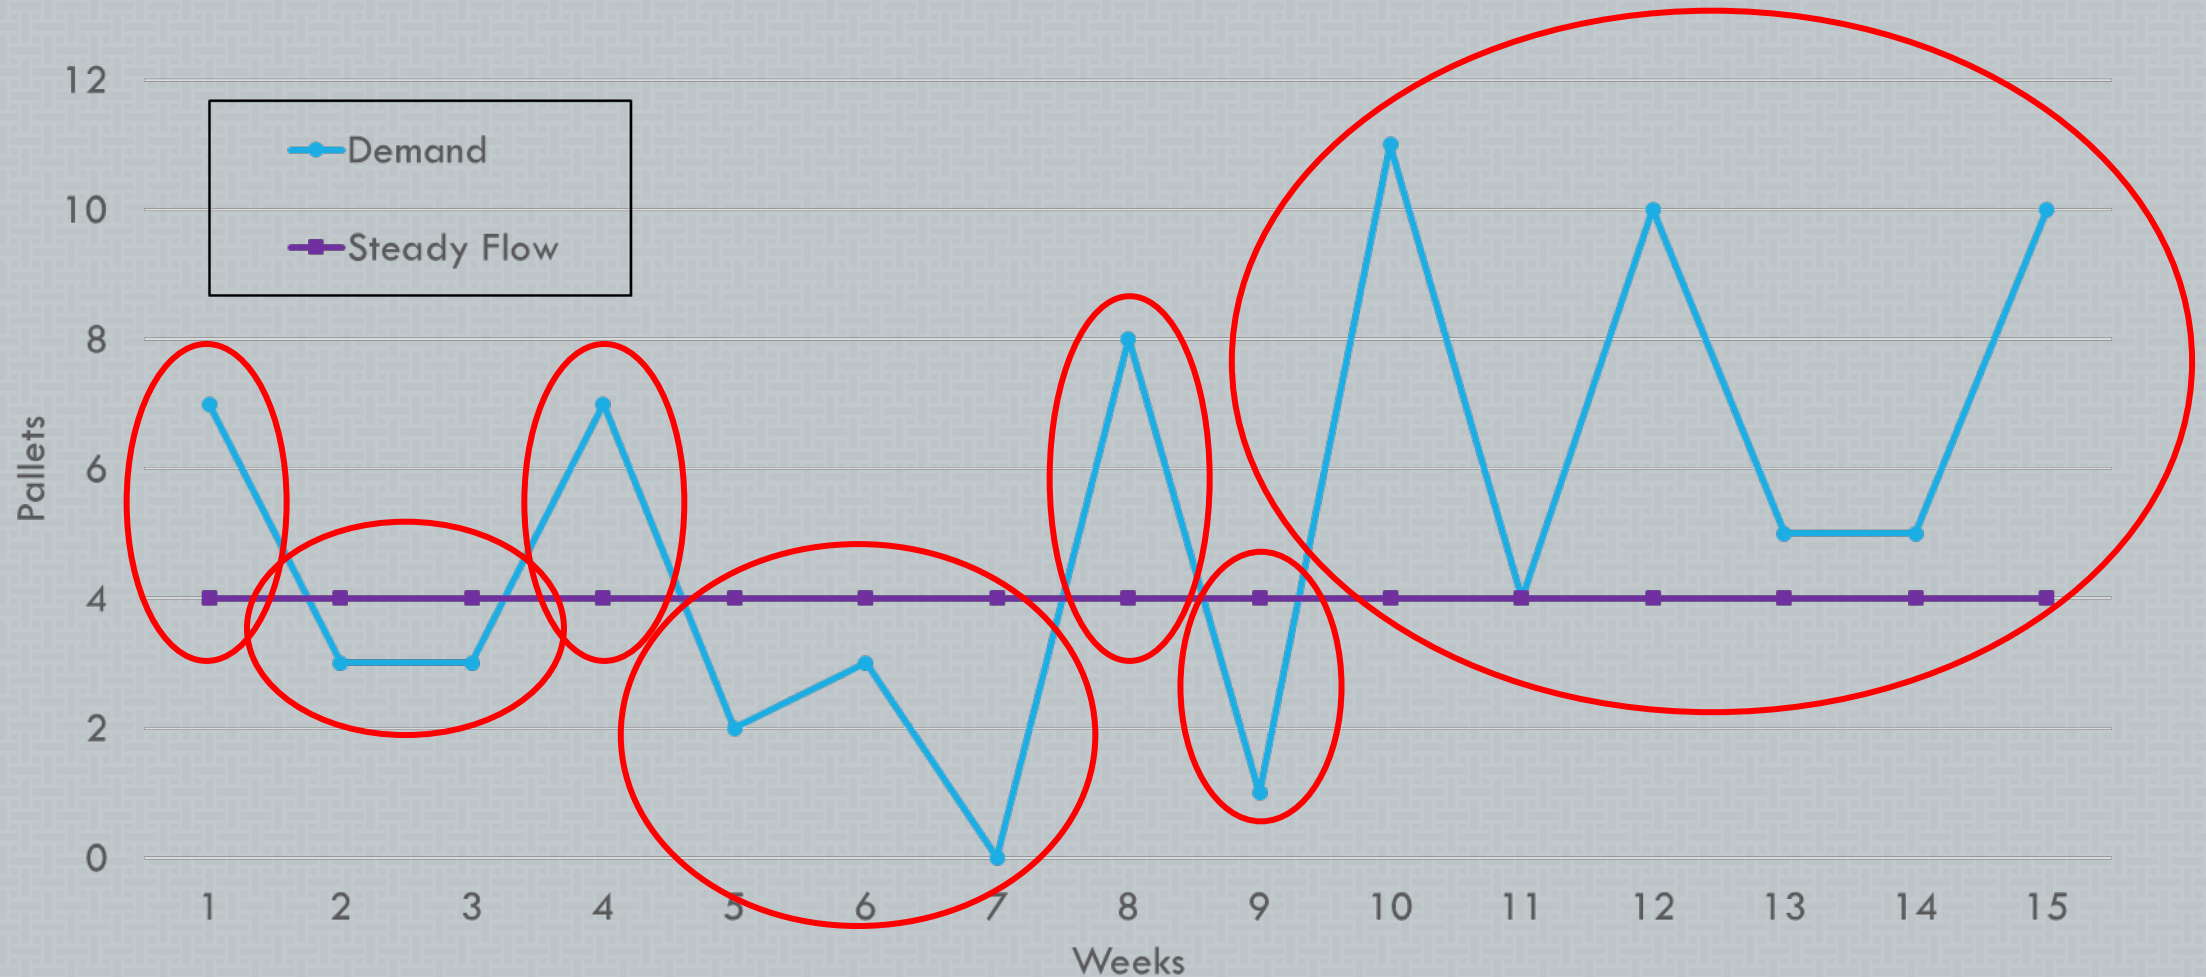

STEADY FLOW OPTIMIZATION

$$\boxed{\text{Transportation Savings}} = \sum_{\text{All periods}} \left\{ \frac{\text{\# of pallets of Steady Flow}}{\text{Pallet}} * \frac{\text{\% of truck that a pallet represents}}{\text{Truck Pallet}} * \frac{\text{Transportation Savings per truck}}{\text{\$ Truck}} \right\}$$

$$\text{Transportation Savings} = \sum_{i=1}^n (s * j * p)$$

STEADY FLOW OPTIMIZATION

Cross-dock
Savings Theory

STEADY FLOW OPTIMIZATION

Cross-dock
Savings Theory

STEADY FLOW OPTIMIZATION

Cross-dock Savings = $\sum_{\text{All periods}}$ $\left\{ \begin{array}{l} \text{\# of pallets that can} \\ \text{be cross-docked} \end{array} \right\} * \text{Cross-dock savings per pallet} * \text{Cross-dock eligibility}$

$\text{MIN (Steady Flow, Demand)}$

$\frac{\text{Pallet}}{\text{Pallet}}$
 $\frac{\$}{\text{Pallet}}$
 $\%$

$$\text{Crossdock Savings} = \sum_{i=1}^n \text{Min}(s, d_i) * c_s * c_e$$

STEADY FLOW OPTIMIZATION

Excess Inventory Theory

STEADY FLOW OPTIMIZATION

Excess Inventory Cost = $\sum_{\text{All periods}} \left\{ \left(\frac{\text{Excess pallets from previous period}}{\text{Pallet}} + \frac{\text{Excess pallets from current period}}{\text{Pallet}} \right) * \frac{\% \text{ of truck that a pallet represents}}{\frac{\text{Truck}}{\text{Pallet}}} * \frac{\text{Inventory holding cost per truck per week}}{\%} * \frac{\text{Inventory value per truck per week}}{\frac{\$}{\text{Truck}}} \right\}$

+ $\left\{ \frac{\text{Pallets left at the end of the period}}{\text{Pallet}} * \frac{\% \text{ of truck that a pallet represents}}{\frac{\text{Truck}}{\text{Pallet}}} * \frac{\text{End of period penalty}}{\frac{\$}{\text{Truck}}} * \frac{\text{Risk factor}}{\%} \right\}$

$$\text{Excess Inventory Cost} = \left\{ \sum_{i=1}^n \text{Max}((e_{i-1} + s - d_i), 0) * j * h * v \right\} + \{ \text{Max}((e_{n-1} + s - d_n), 0) * j * v * r \}$$

STEADY FLOW OPTIMIZATION

$$\textit{Total Savings} = \textit{Transportation Savings} + \textit{Crossdock Savings} - \textit{Excess Inventory Cost}$$

Objective Function: MAXIMIZE Total Savings

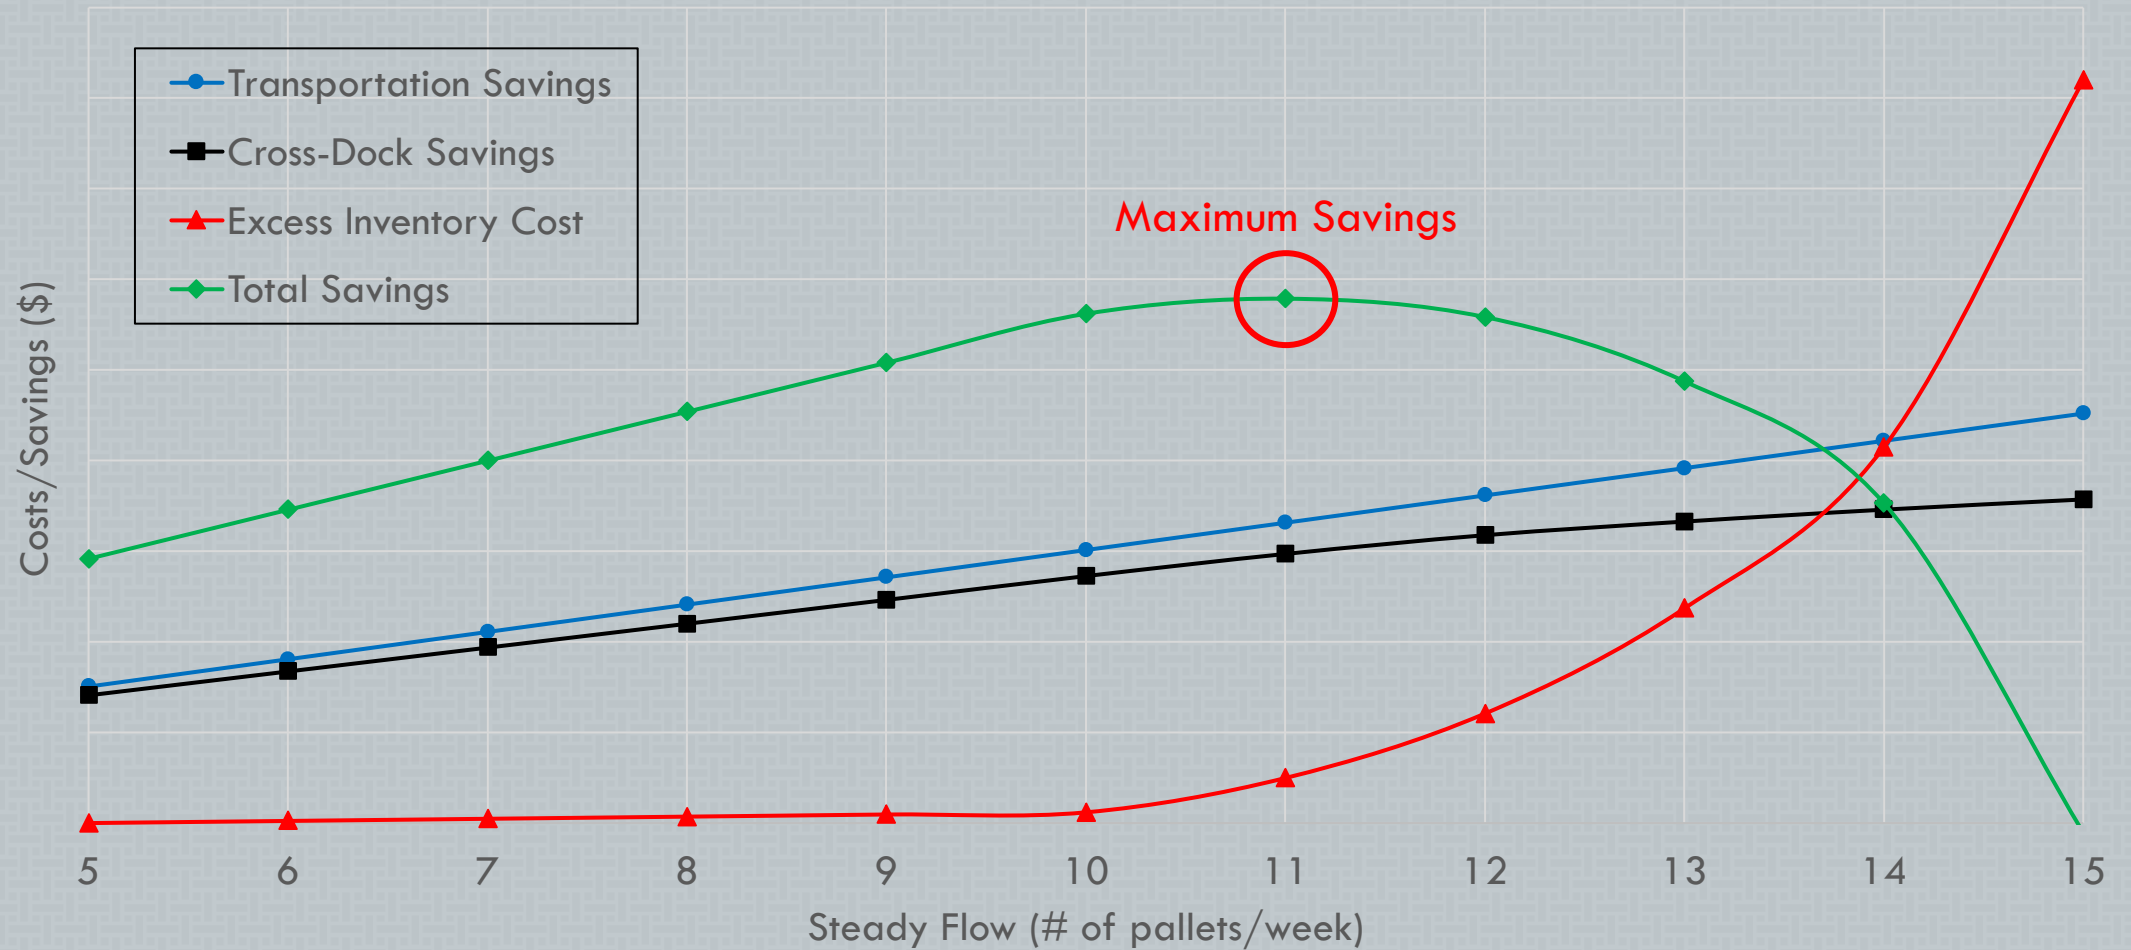

Decision Variable: # of pallets on steady flow (s)

$$\textit{Transportation Savings} = \sum_{i=1}^n (s * j * p)$$

$$\textit{Crossdock Savings} = \sum_{i=1}^n \text{Min}(s, d_i) * c_s * c_e$$

$$\textit{Excess Inventory Cost} = \left\{ \sum_{i=1}^n \text{Max}((e_{i-1} + s - d_i), 0) * j * h * v \right\} + \{ \text{Max}((e_{n-1} + s - d_n), 0) * j * v * r \}$$

SKU EXAMPLE 1

Demand Characteristics			
Minimum (pallets/week)	28	% weeks shipped	100%
Mean (pallets/week)	37.7	COV	0.13
Std Dev (pallets/week)	4.80		
Moderate Volume, Stable SKU			

SKU EXAMPLE 1

Demand Characteristics			
Minimum (pallets/week)	28	% weeks shipped	100%
Mean (pallets/week)	37.7	COV	0.13
Std Dev (pallets/week)	4.80		
Moderate Volume, Stable SKU			

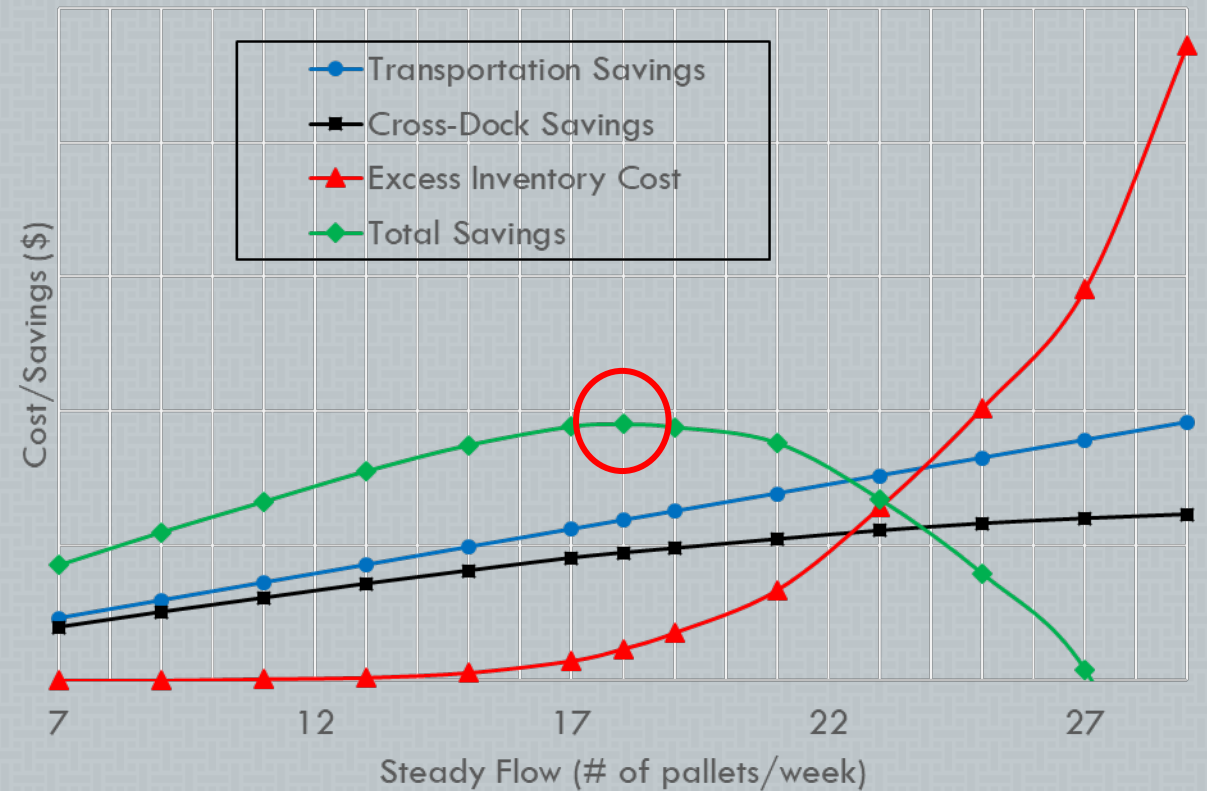

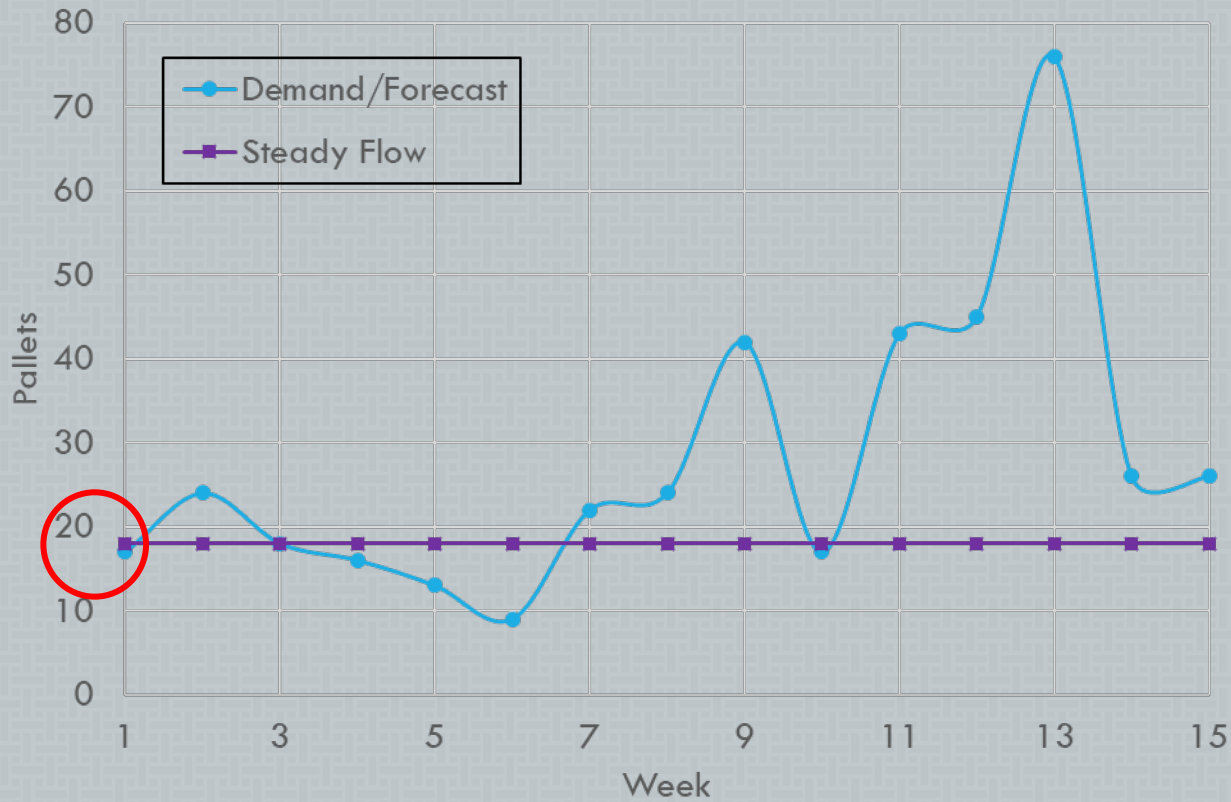

SKU EXAMPLE 2

Demand Characteristics			
Minimum (pallets/week)	9	% weeks shipped	100%
Mean (pallets/week)	27.9	COV	0.60
Std Dev (pallets/week)	16.7		
High COV SKU			

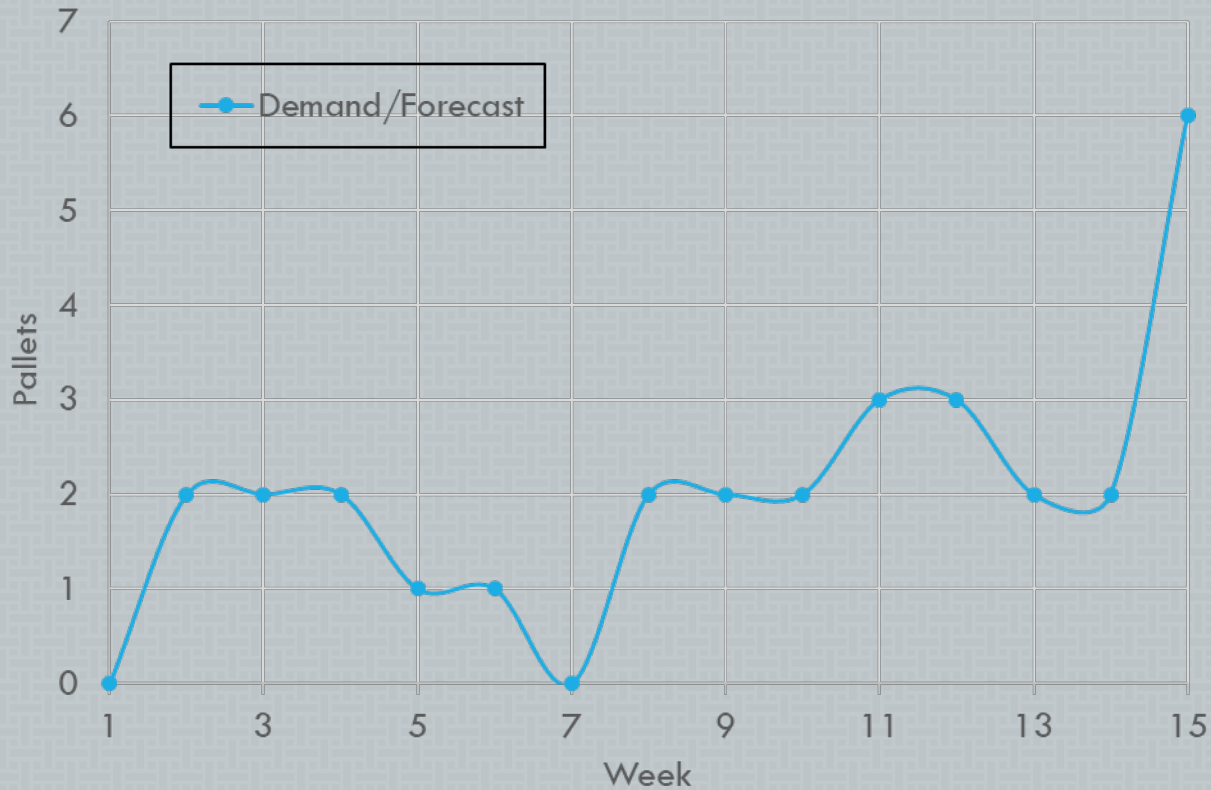

SKU EXAMPLE 2

Demand Characteristics			
Minimum (pallets/week)	9	% weeks shipped	100%
Mean (pallets/week)	27.9	COV	0.60
Std Dev (pallets/week)	16.7		
High COV SKU			

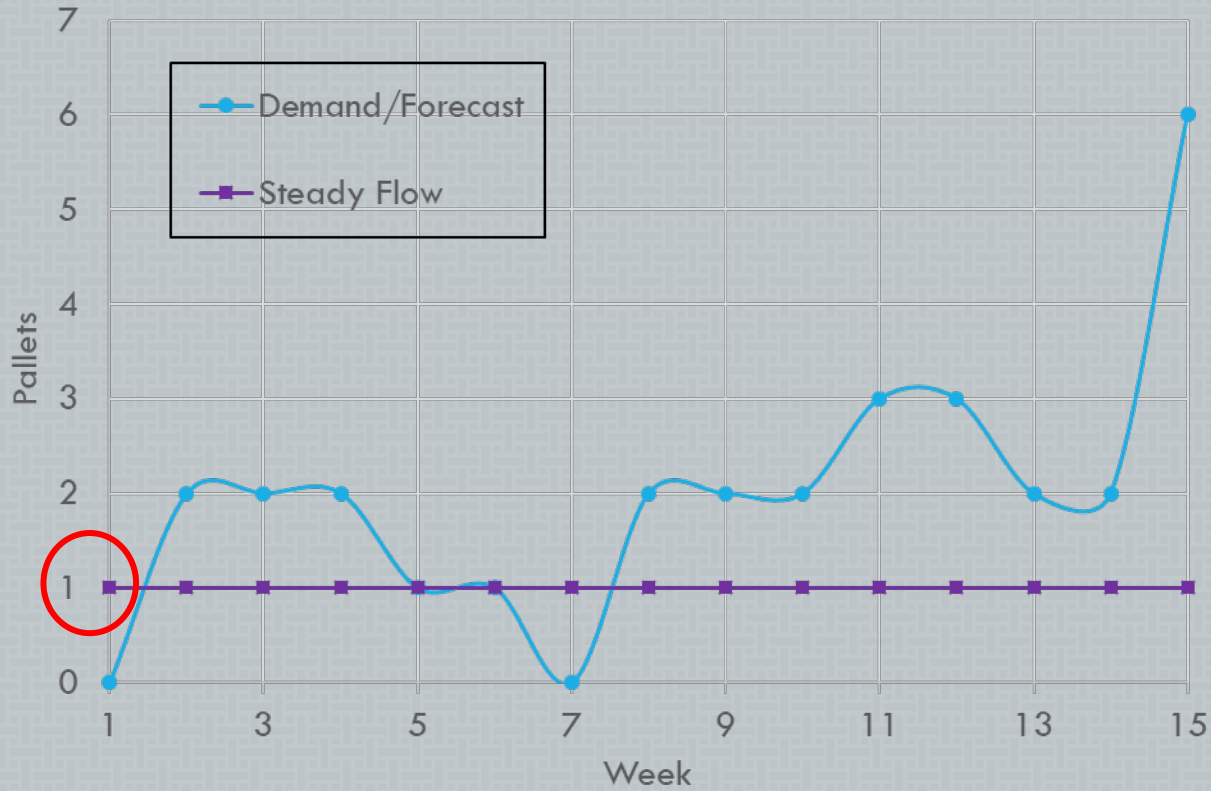

SKU EXAMPLE 3

Demand Characteristics			
Minimum (pallets/week)	1	% weeks shipped	87%
Mean (pallets/week)	2.3	COV	0.52
Std Dev (pallets/week)	1.20		
Low Volume, Not Shipped Every Week			

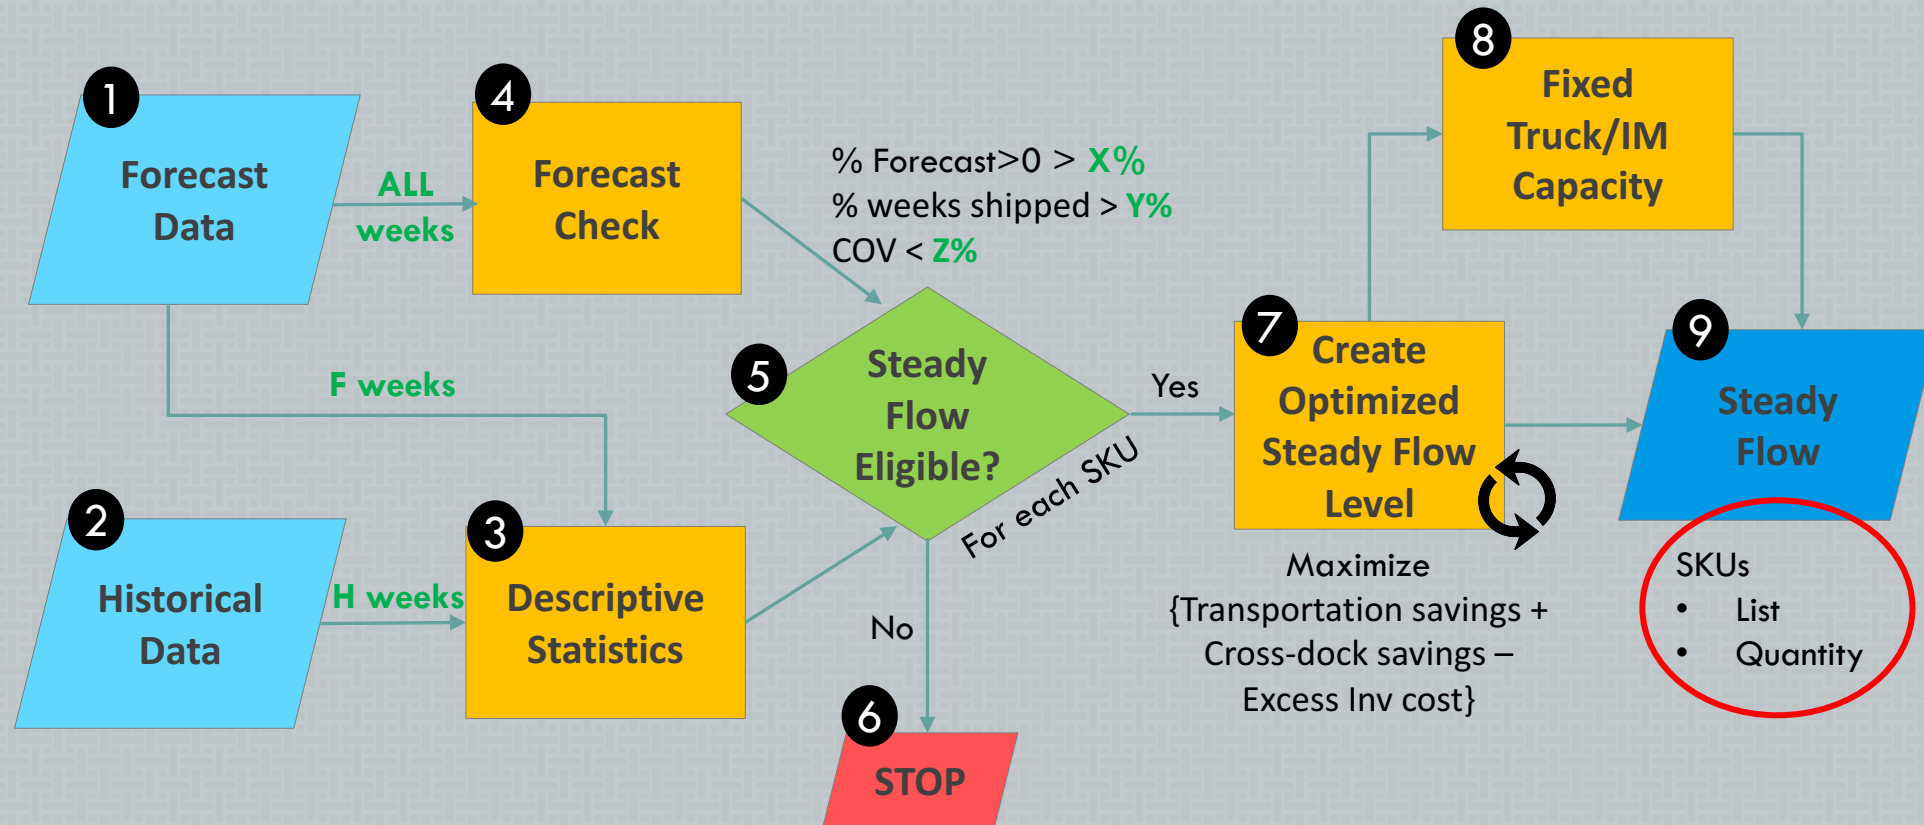

SKU EXAMPLE 3

Demand Characteristics			
Minimum (pallets/week)	1	% weeks shipped	87%
Mean (pallets/week)	2.3	COV	0.52
Std Dev (pallets/week)	1.20		
Low Volume, Not Shipped Every Week

NEXT STEPS

Model Enhancements

- Data Aggregation
- Other Savings/Cost Considerations
- SKU Selection

Analysis

- Parameter Tuning
- Multiple Lane Analysis
- Demand Segmentation

Processes

- Update Frequency
- Contract Innovation
- Distribution Resource Planning (DRP)

IMPLICATIONS

THANK YOU!
